

Spatial photon correlations using nearly dead time free ultra-high throughput single photon detection

Verena Leopold & Sebastian Karl

Quantum Optics and Quantum Information

Friedrich-Alexander Universität Erlangen-Nürnberg

Stellar Intensity Interferometry Workshop 2024

Agenda

1. Introduction
2. Measurement Setup
3. Temporal Correlations at C2PU
4. The Problem of moving Stars
5. Spatial Correlations using HPDs
6. High Throughput System (HTS)
7. Spatial Correlations using HTS
8. Summary and Outlook

Introduction

Motivation

- Larger telescopes increase SNR in HBT measurements
- For bright stars: hybrid single photon detectors saturate for telescopes $> 1\text{m}$
- For spatial correlations ordered timestamp stream is necessary
- Manageable data rate

Solutions:

- 1) Use new kind of detector
- 2) Find Synchronization hardware
- 3) Use high throughput TDC

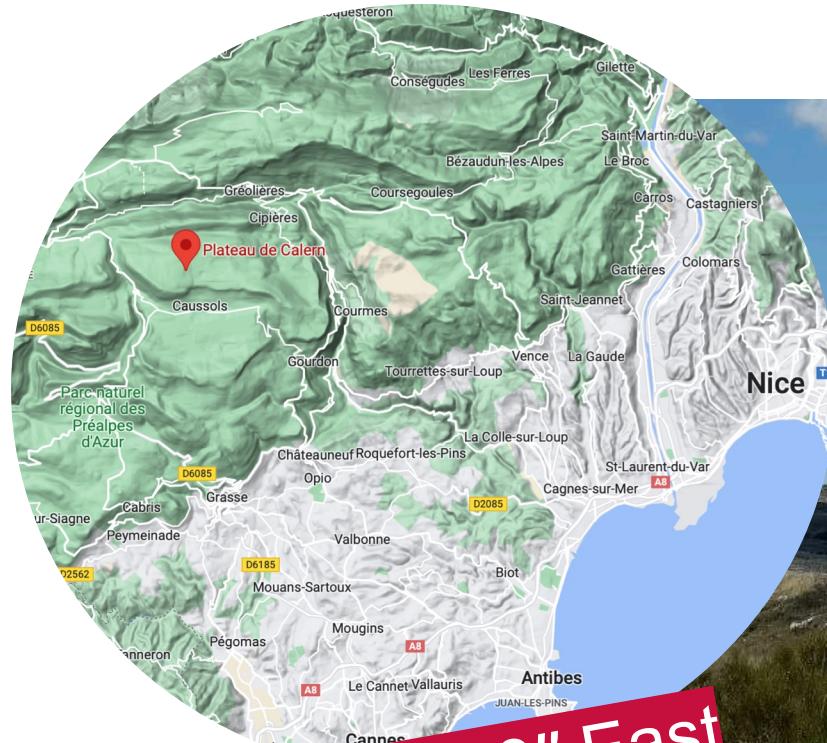

Telescope Site

The Calern observatory is located in the South of France close to Nice on a plateau with an altitude of 1270m. C2PU offers twin telescopes at a separation of 15m.

FAU

- Primary mirror diameter of 1.04 m
- Equatorial yoke mount
- Cassegrain secondary focus
- Focal length of 13m and F/12.5

06°55'23" East
43°45'13" North

Telescope Site

FAU

The Calern observatory is located in the South of France close to Nice on a plateau with an altitude of 1270m. C2PU offers twin telescopes at a separation of 15m.

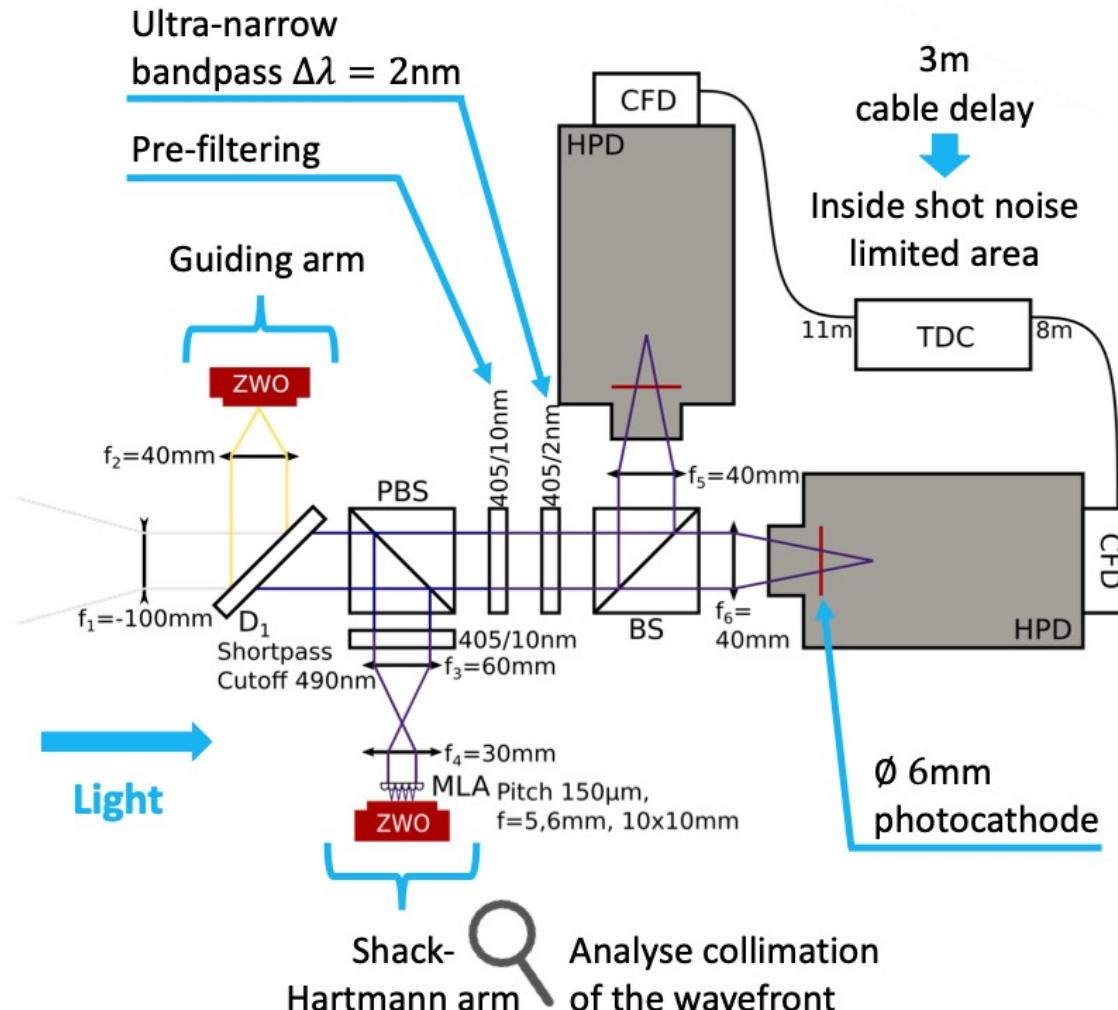

- Primary mirror diameter of 1.04 m
- Equatorial yoke mount
- Cassegrain secondary focus
- Focal length of 13m and F/12.5

East Dome
Epsilon
Omicron
West Dome

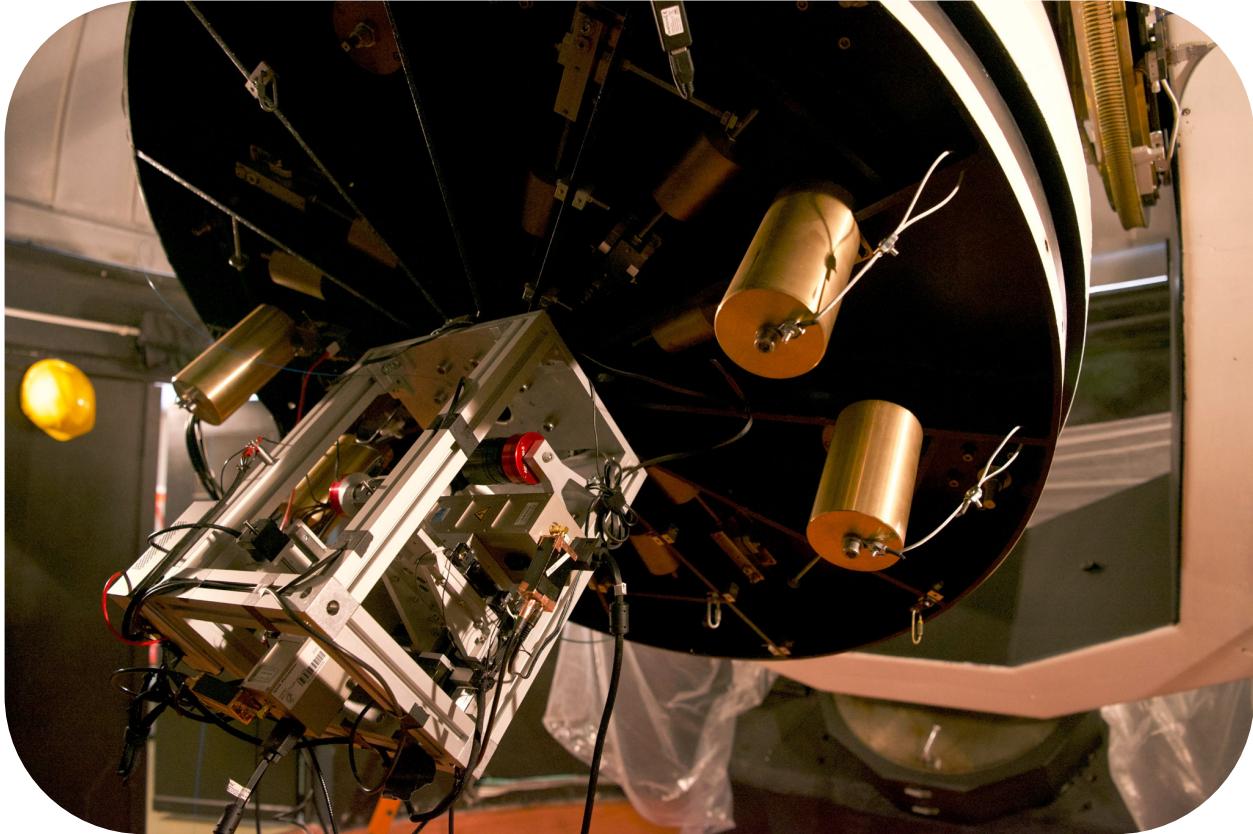

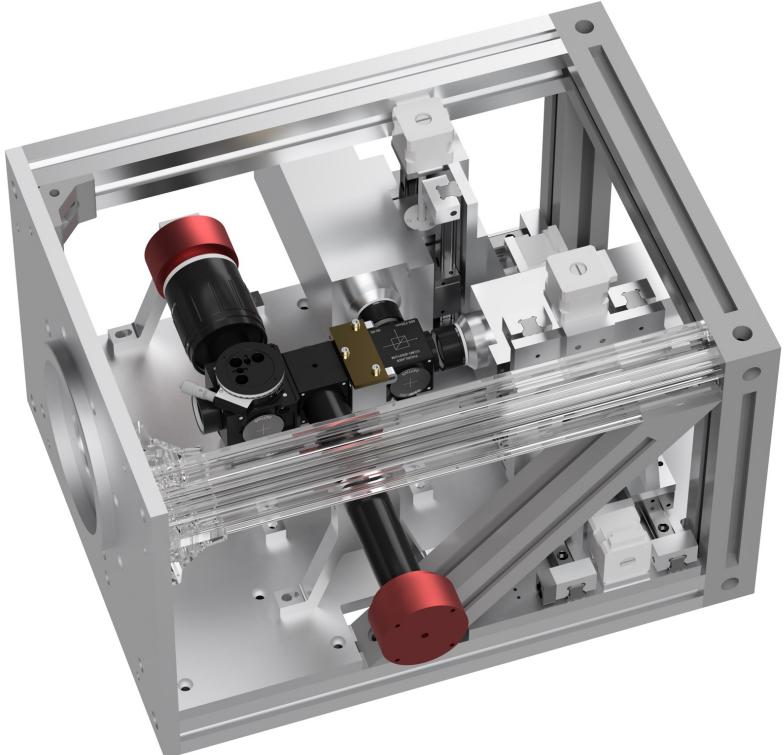

Measurement Setup

Optical Setup

- 40/45mm lenses for beam compression (no focus)
- Used for all three measurements
- TDC and detectors will change
- Cable delays will vary from 3 to 12m

Measurement Setup

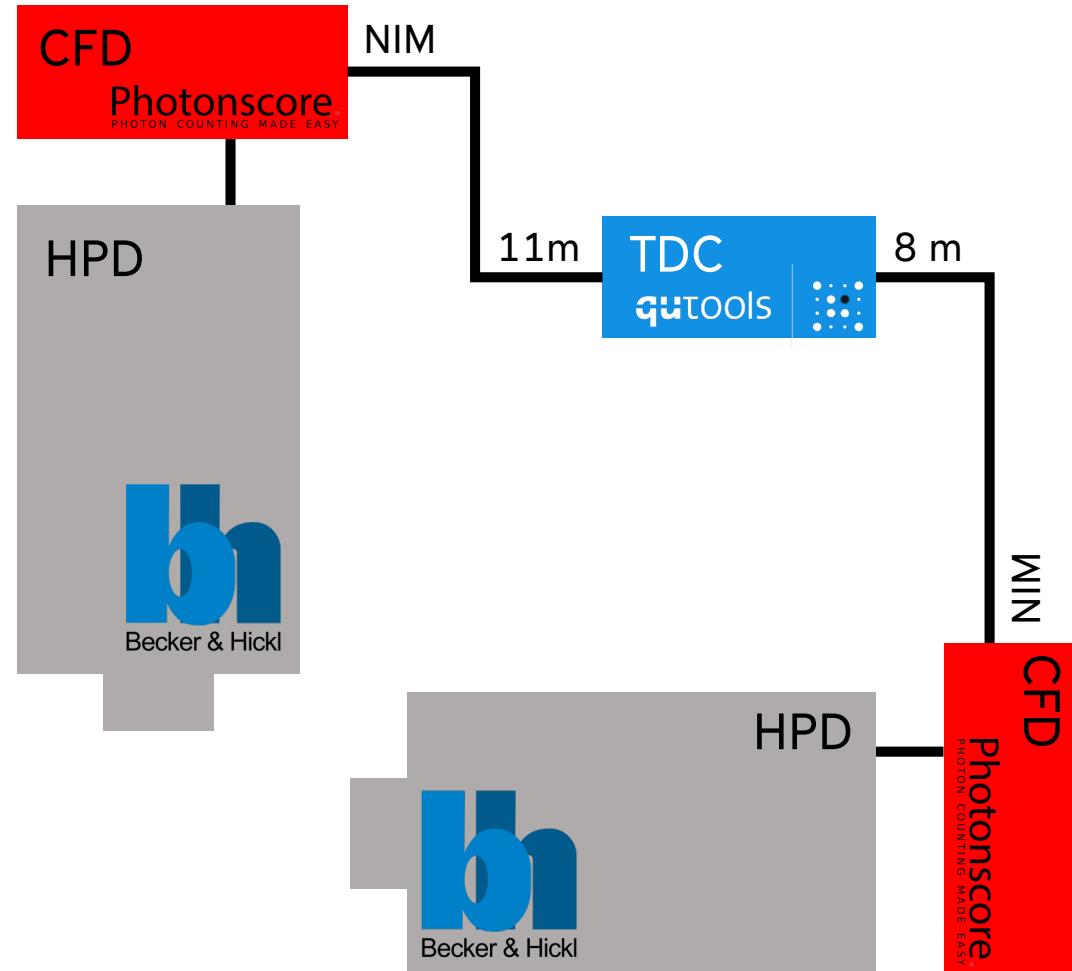

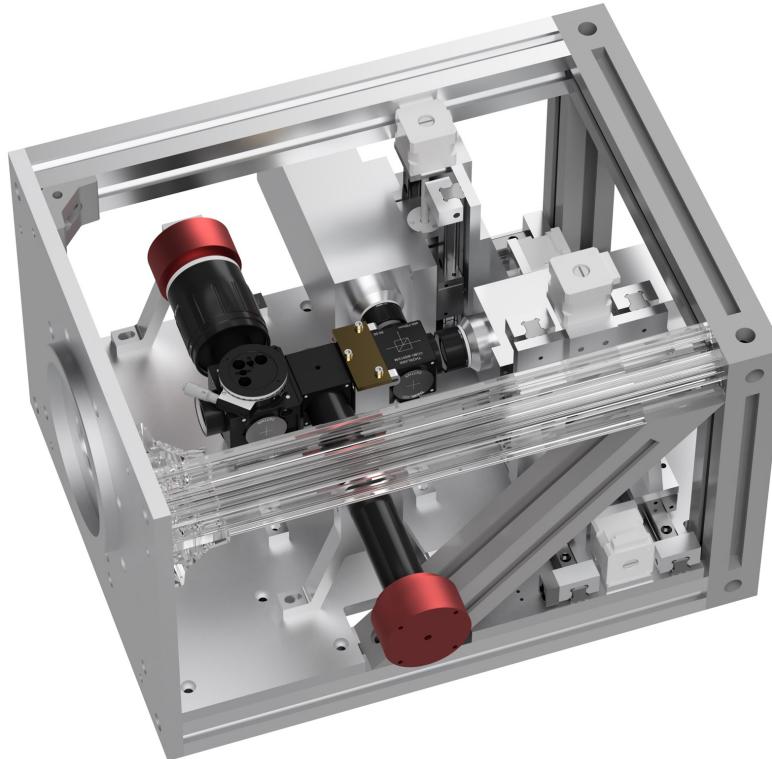

Temporal Correlations at C2PU

Measurement Configuration

Hybrid Photon Detectors (HPDs)

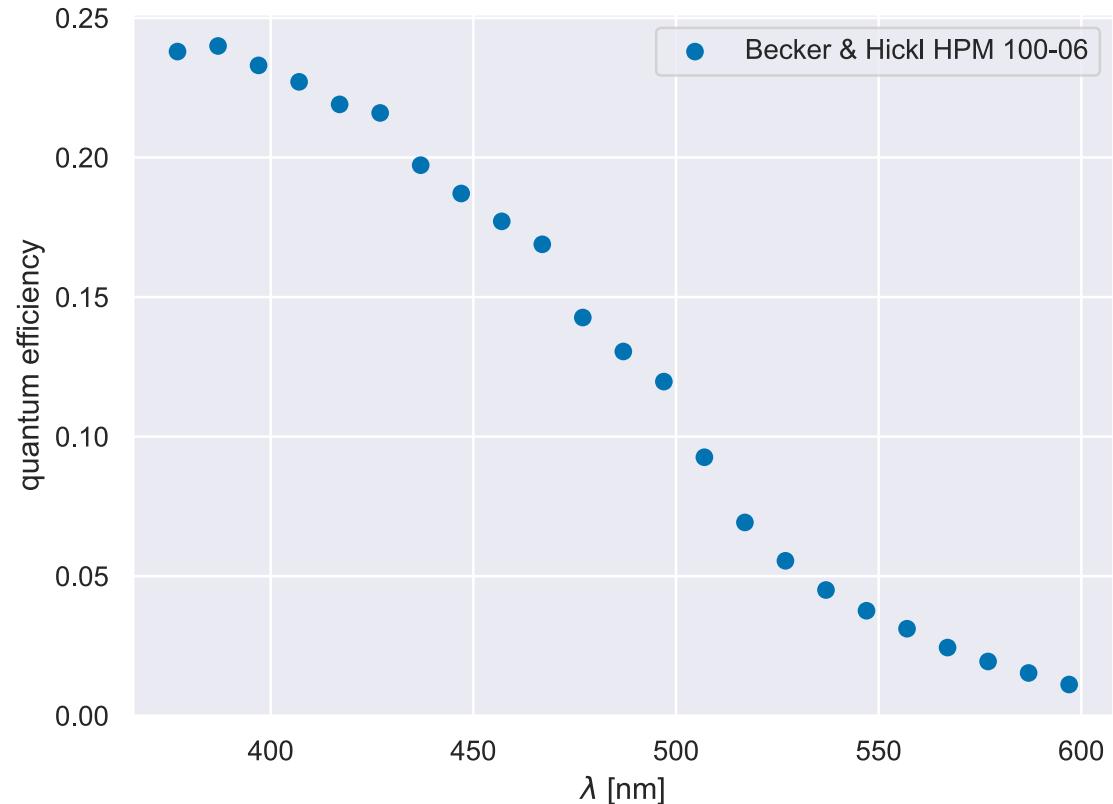

- HPM-100-06 from Becker&Hickl
- Hamamatsu R10467 hybrid detector tube
- Ø6mm active area
- Max. continuous countrate 10MHz
- 100 - 400Hz dark counts
- Quantum efficiency of 22.7% at 405nm
- Output is not discriminated, puls height varies

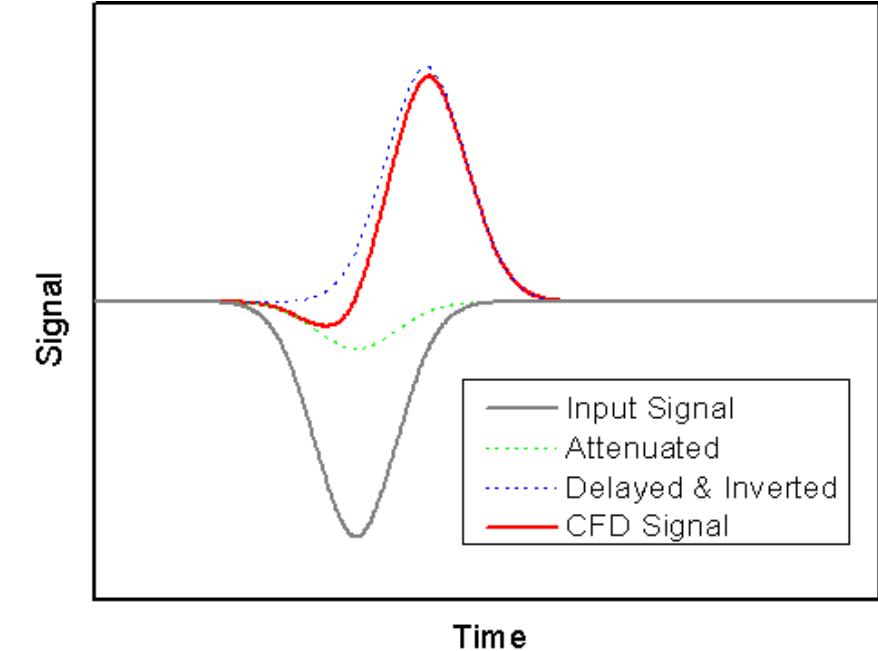

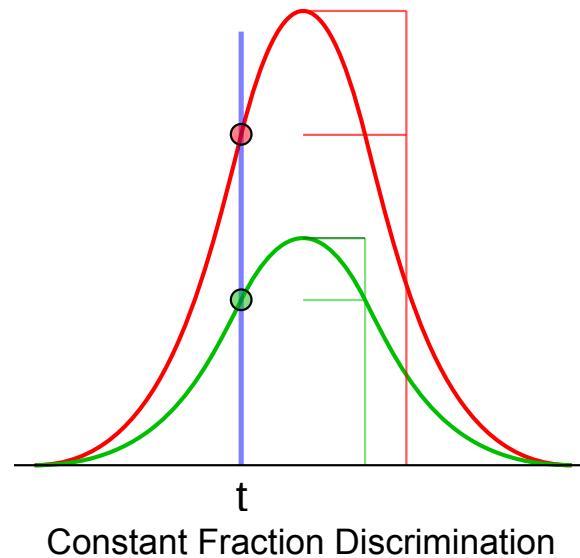

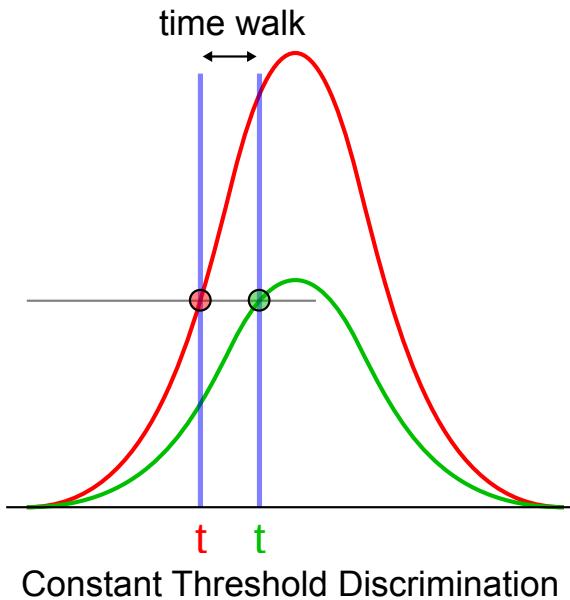

Hybrid Photon Detectors (HPDs)

- HPM-100-06 from Becker&Hickl
- Hamamatsu R10467 hybrid detector tube
- Ø6mm active area
- Max. continuous countrate 10MHz
- 100 - 400Hz dark counts
- Quantum efficiency of 22.7% at 405nm
- Output is not discriminated, puls height varies

Constant Fraction Discriminator (CFD) FAU

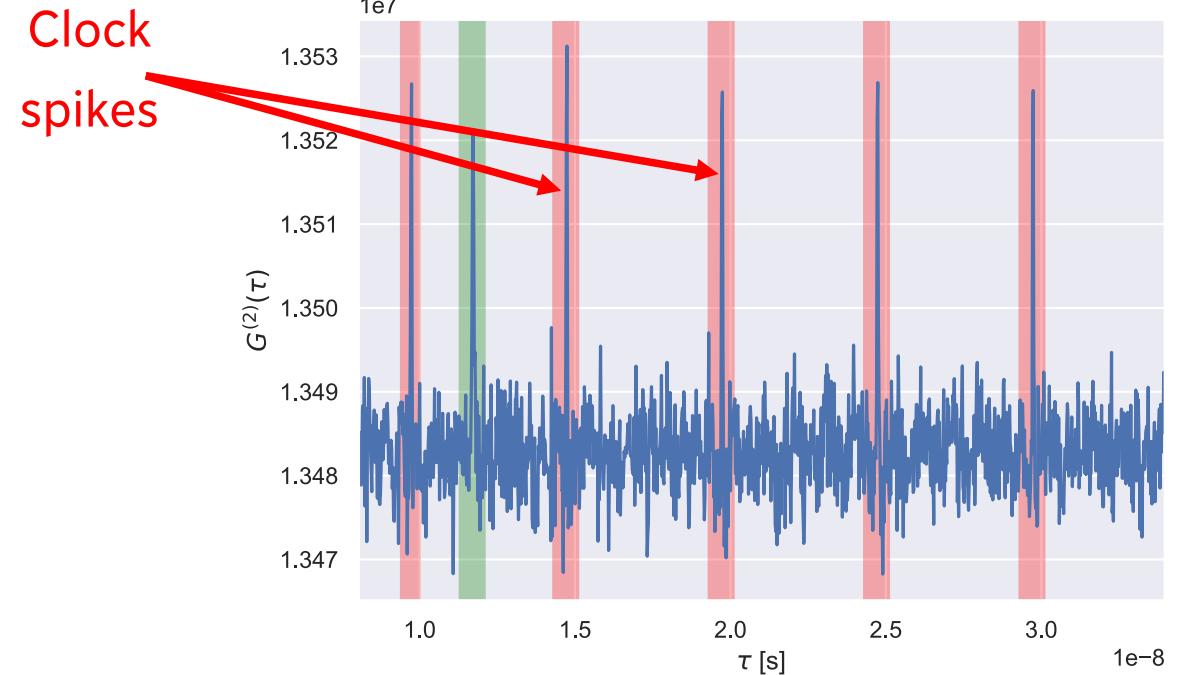

→ Use Constant Fraction instead of Constant Threshold Discriminator

→ Tune parameters *threshold* and *zero crossing*

quTools TDC

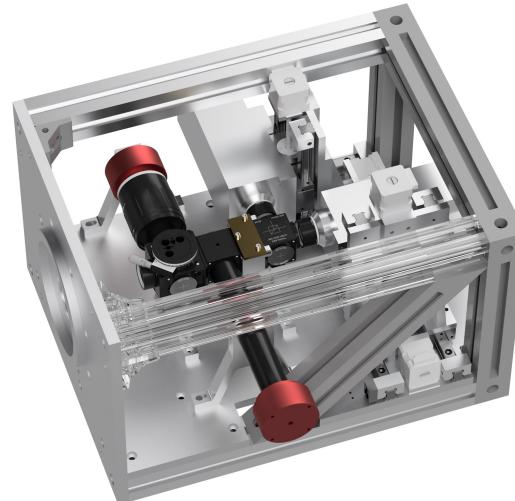

- 40ns deadtime
- maximal event rate per channel is limited to 25 Mcps

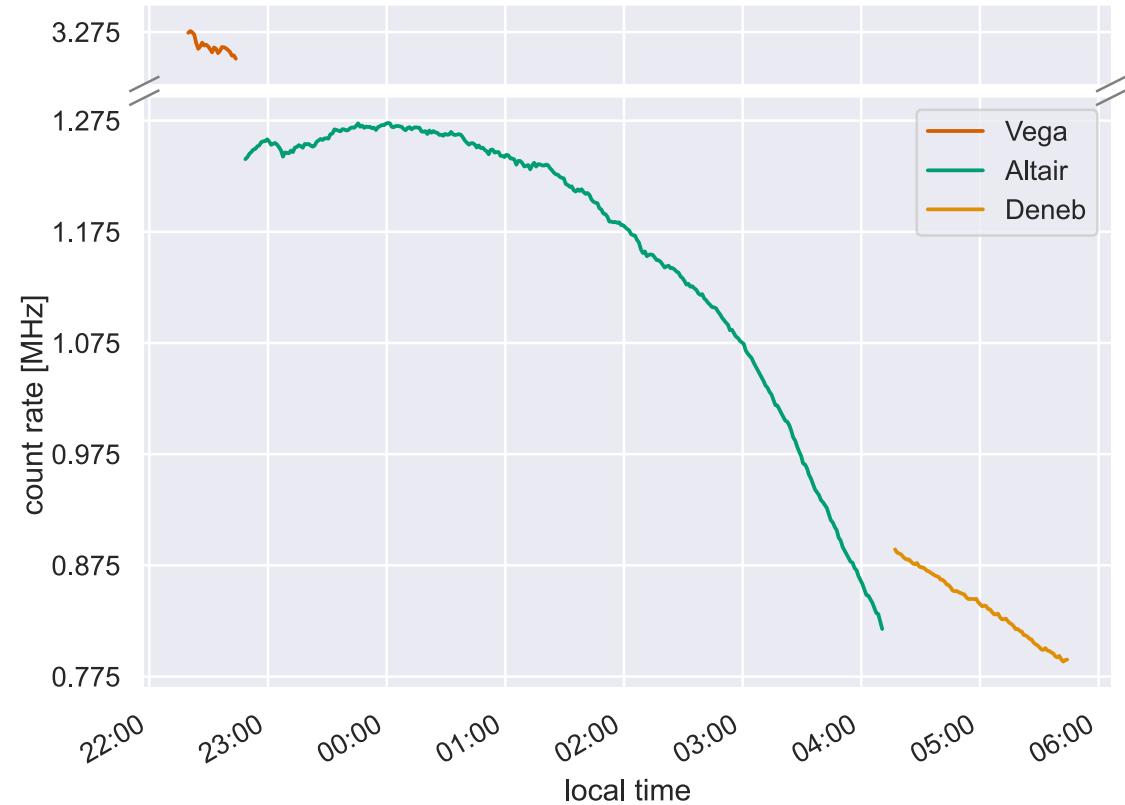

→ 3m cable difference
needed to lie inside a shot
noise limited area

Advantages of the Setup

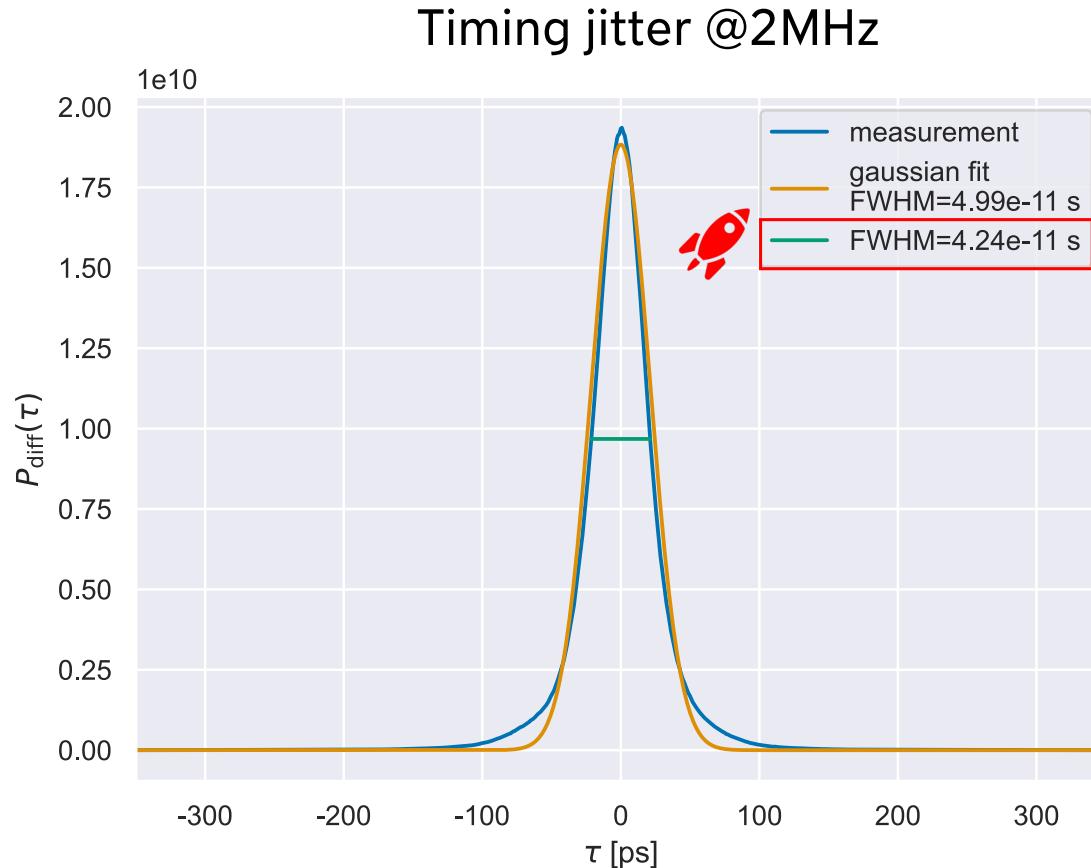

- Tracking of the star never lost
- Short optical path
- Observation in the blue at 405nm
- Easy to align at the telescope
- Movable detectors in x and y-direction

Typical Measurement Night

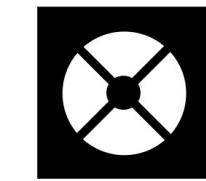

Timing resolution of the setup

- **42.4ps timing jitter** of the system using a fs-pulsed laser
- Full photo detection system of 2 HPDs, 2 CFDs and the quTAG, as well as one 50:50 non-polarizing beam splitter
- Result will be used to calculate the measurement expectations

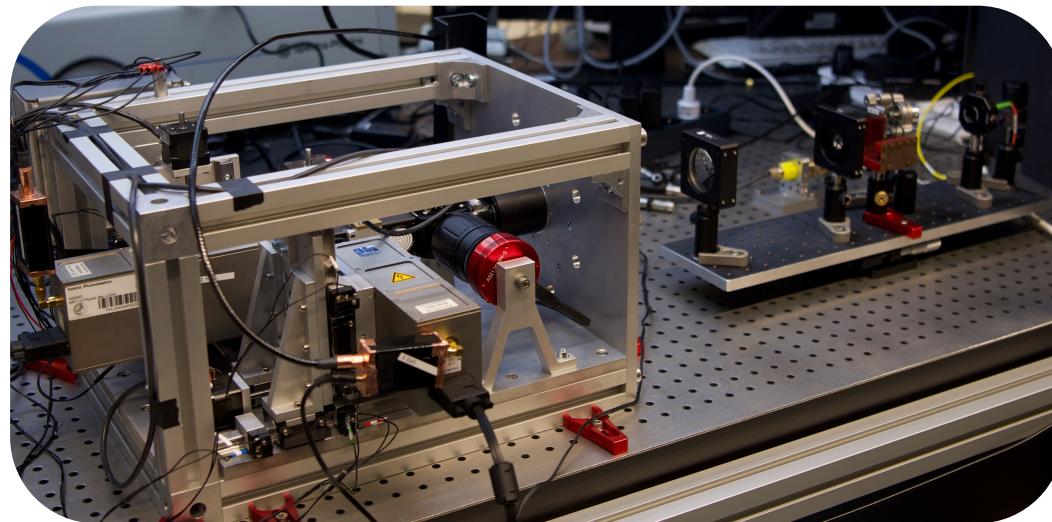

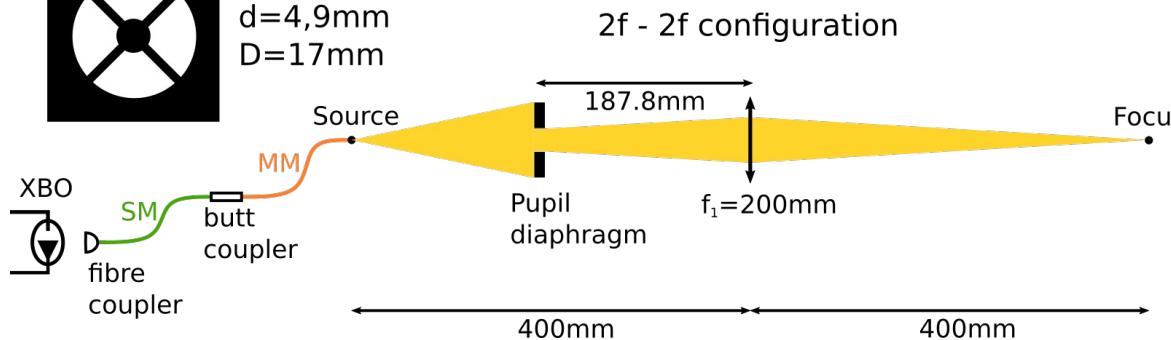

Observe artificial star

Pupil diaphragm

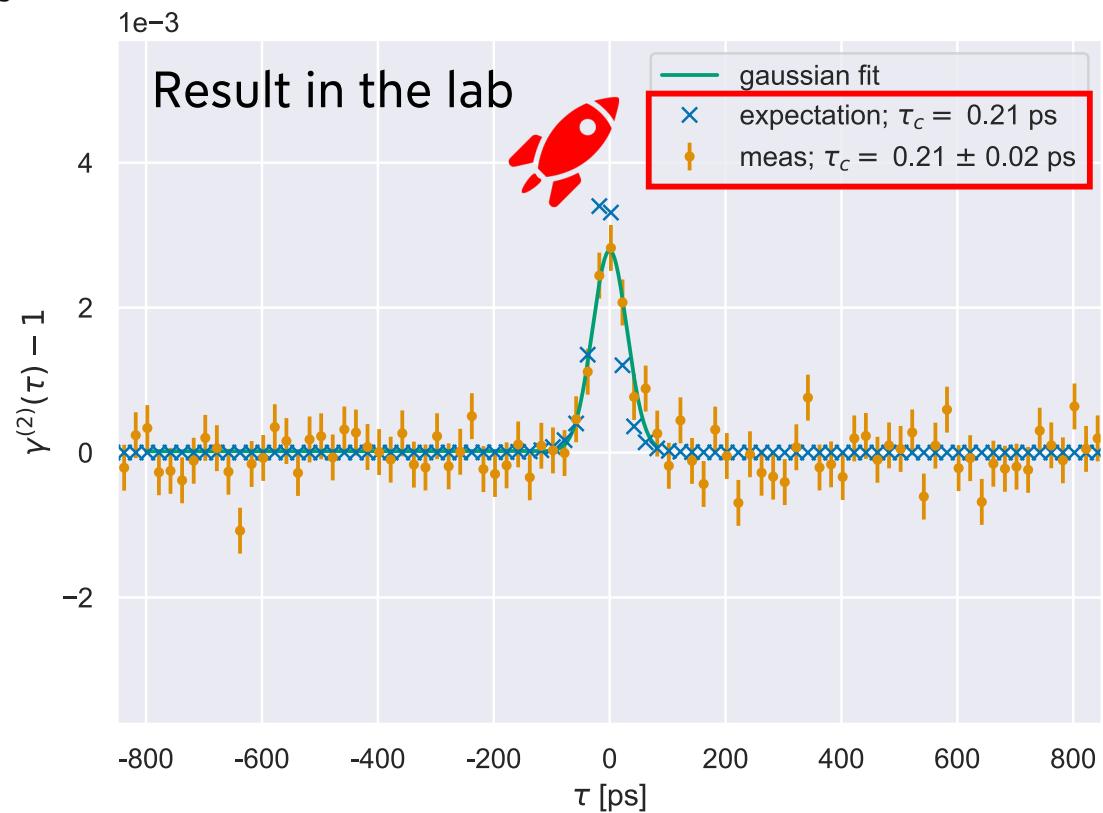

$d=4.9\text{mm}$
 $D=17\text{mm}$

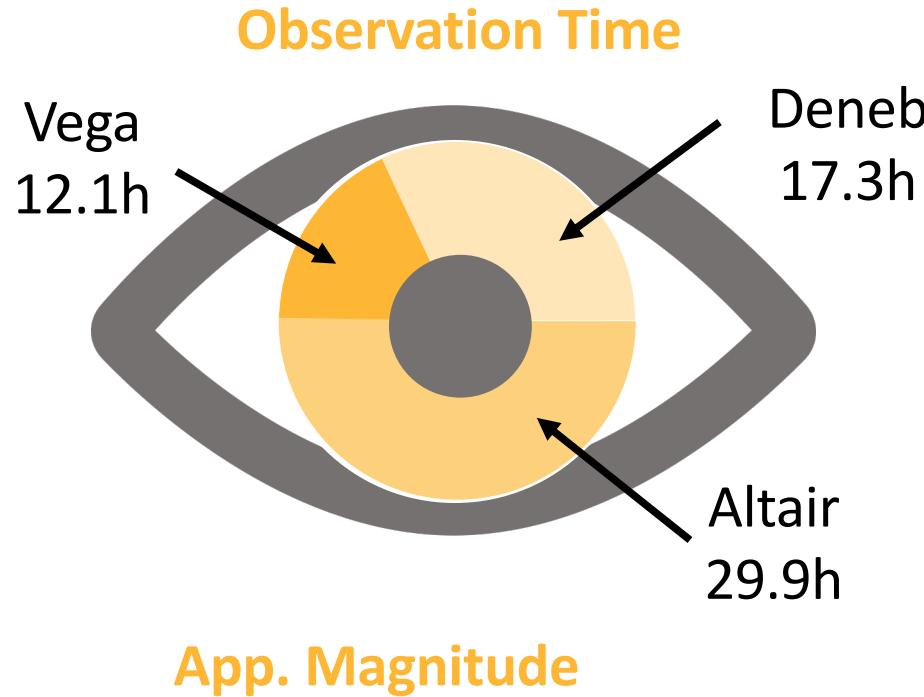

2f - 2f configuration

- Expected coherence time **0.21ps**
- Measured coherence time with artificial star in the lab: **$0.21 \pm 0.02\text{ps}$**

Temporal Correlations at C2PU

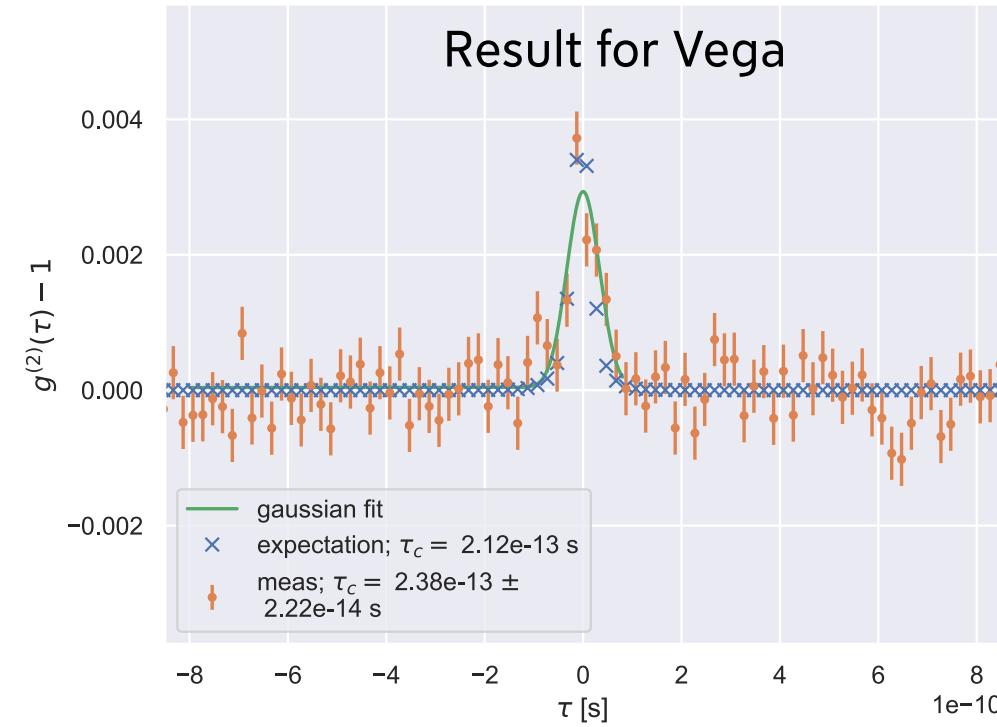

Vega
0.026

Altair
0.76

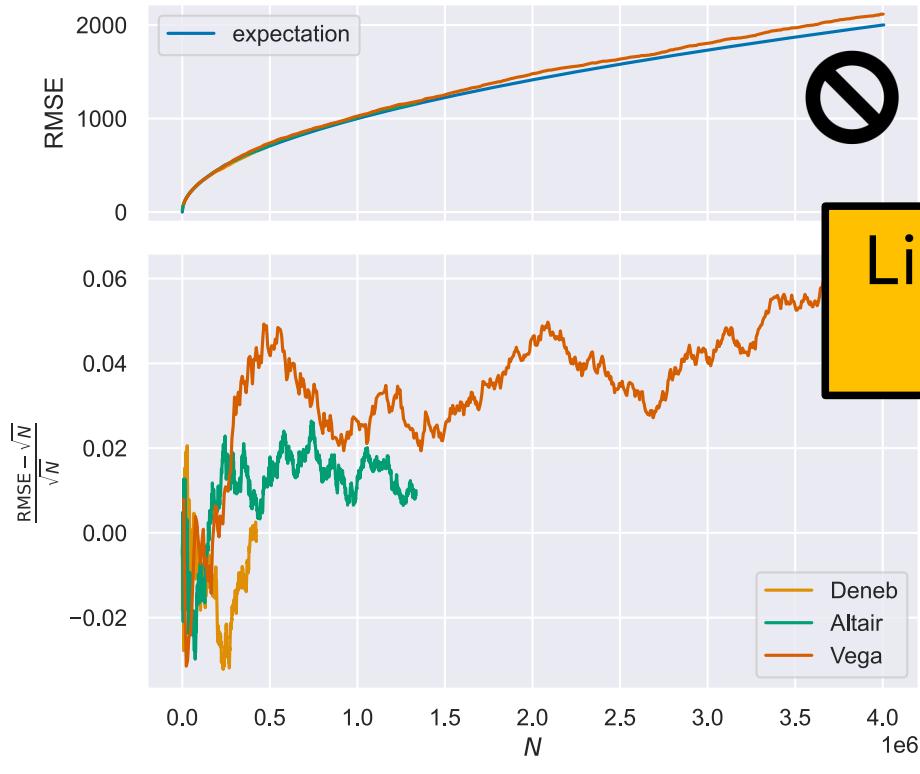

Deneb
1.25

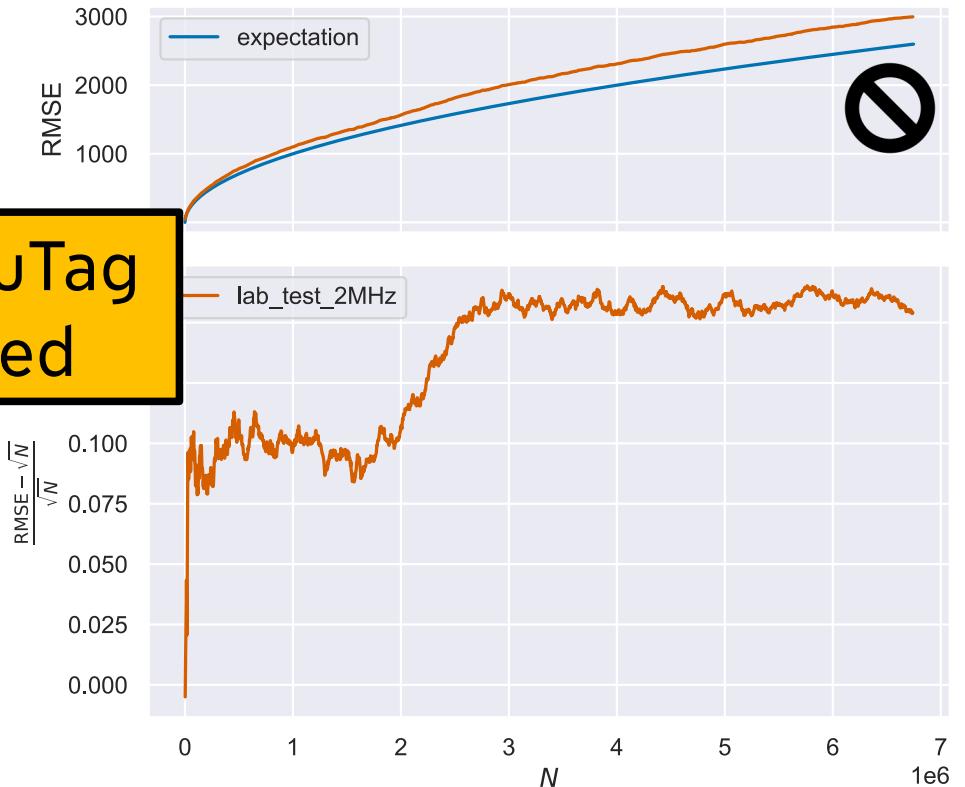

Star	Meas. τ_c [ps]	SNR
Vega	0.238 ± 0.0222	10.72
Altair	0.217 ± 0.0350	6.20
Deneb	0.159 ± 0.0605	2.63

Limitations of the configuration

@Telescope

In the Lab

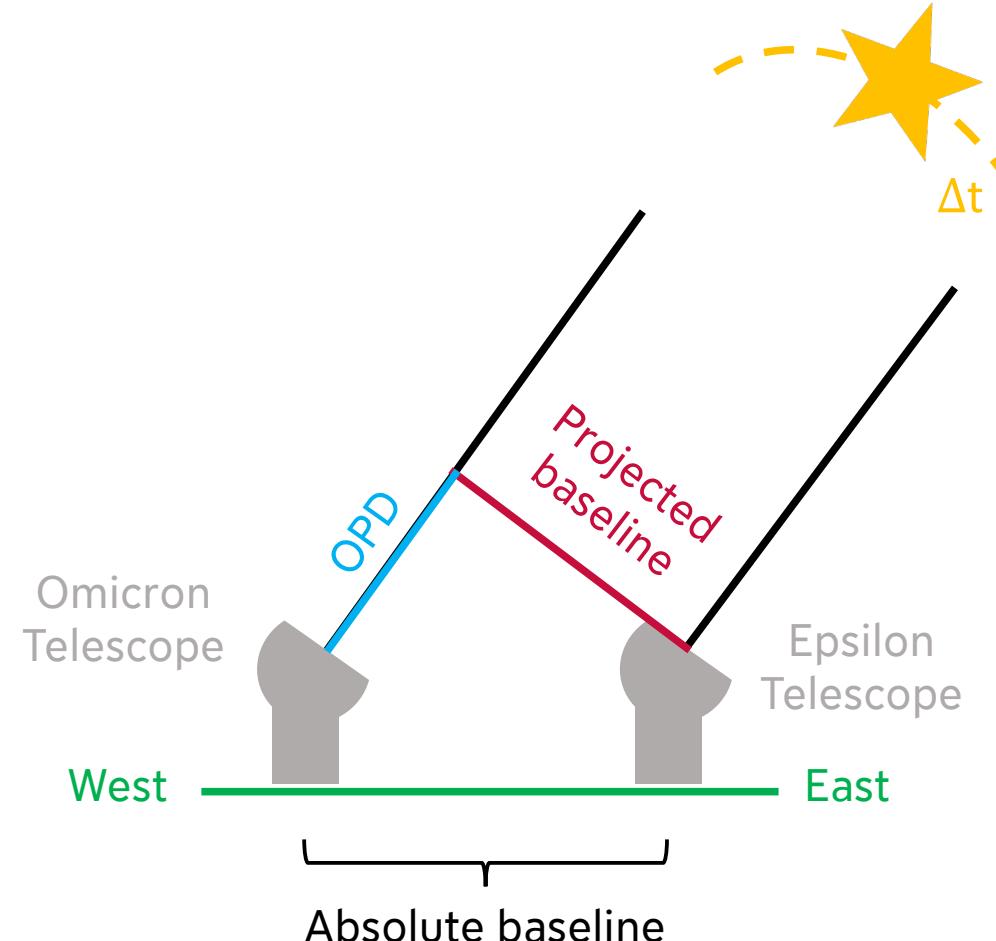

Limit of quTag
is reached

The background of the slide features a dark, star-filled space scene with numerous small stars of varying brightness and several larger, more prominent galaxies and nebulae.

The Problem of moving Stars

Calculation of baselines

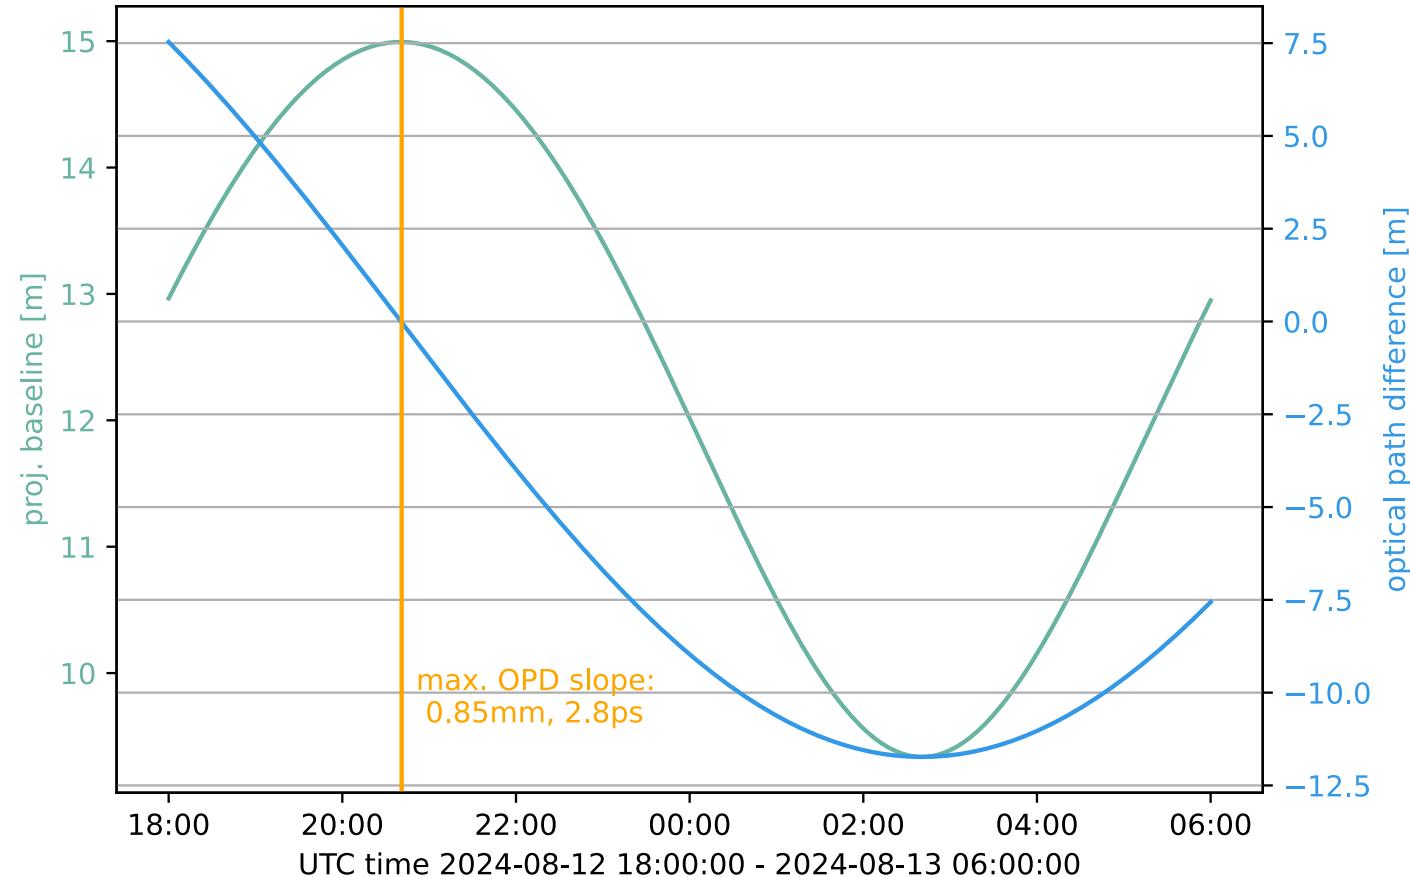

- Absolute baseline of C2PU is 15m
- Baseline changes as star moves over the sky
- Calculate **projected baseline** for Δt
- Calculate **optical path difference** (OPD) for Δt
- Shift each histogram accordingly

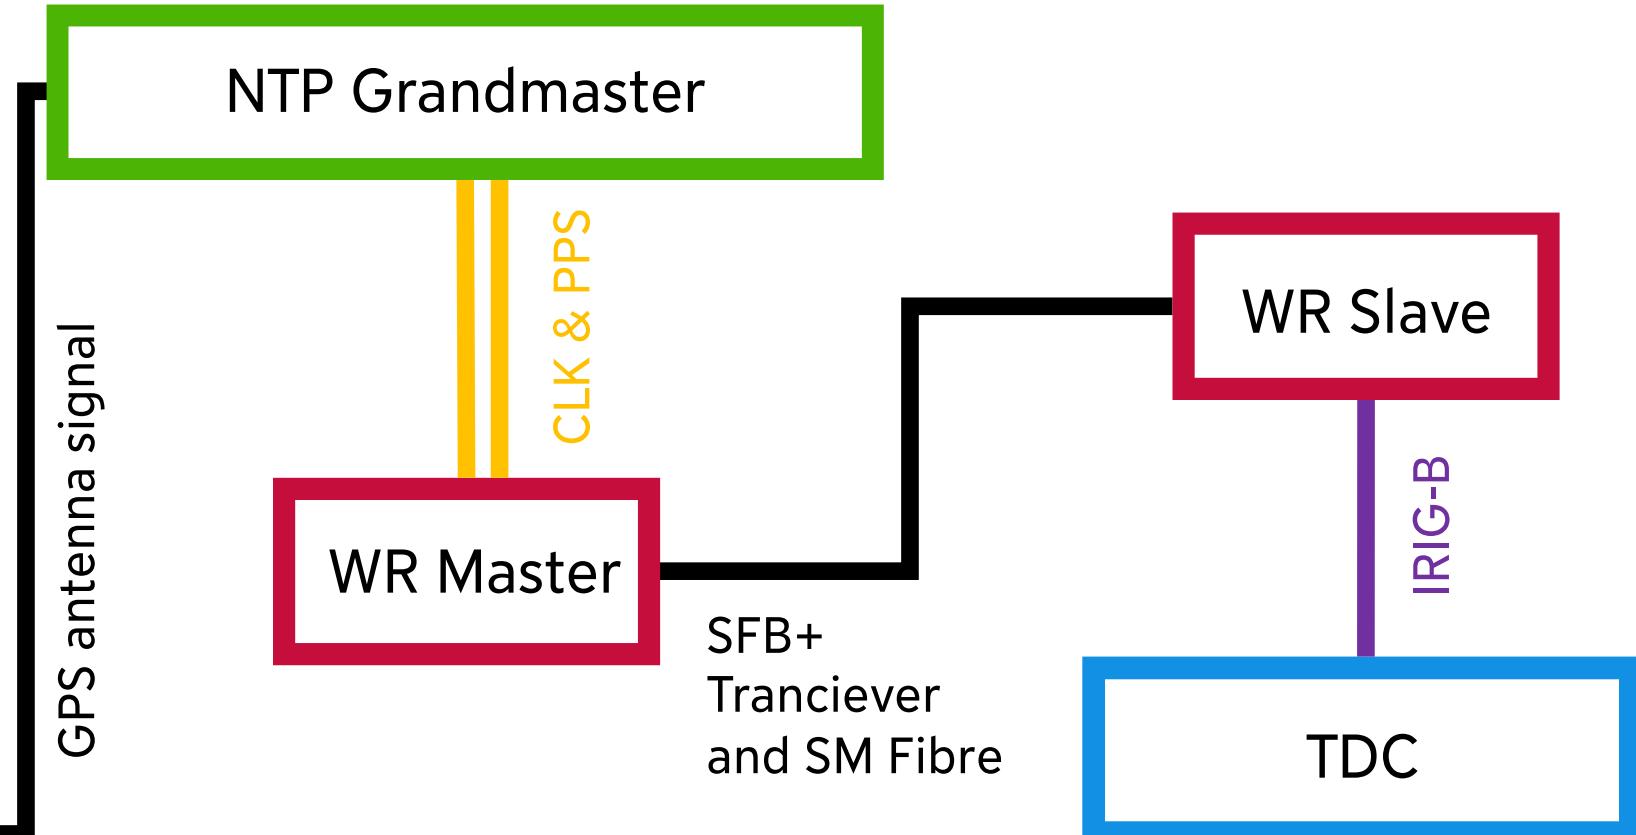

Optical path difference (OPD)

- OPD slope needs to be < timing jitter of system
- Max. OPD slope: 0.85mm, 2.8ps per second
- Need UTC timestamps every second for OPD calculation

Vega

Obtaining UTC timestamps

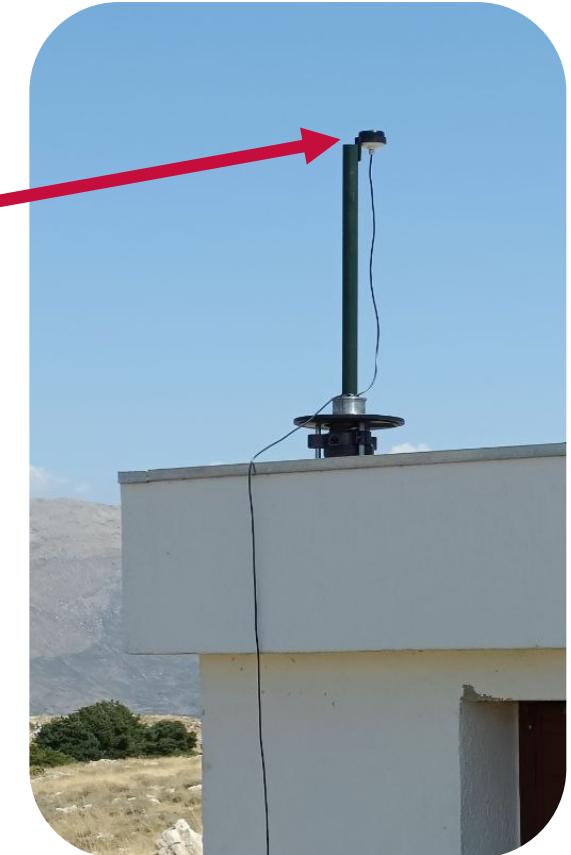

Synchronization Hardware

NTP
Grand-
master

NTP Grandmaster

- DTS 4160.Grandmaster from Bürk MobaTime
- 10MHz and PPS output to feed WR
- External time via GPS antenna
- GPS-synchronizable oscillator
- Oven Controlled Crystal Oscillator: 5 ps/s
- Provides UTC timestamps

Synchronization Hardware

FAU

White
Rabbit
LEN

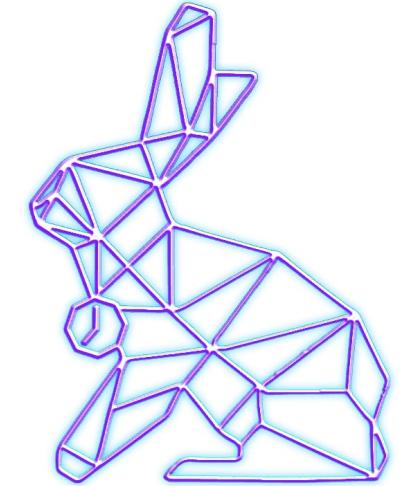

NTP
Grand-
master

White Rabbit (WR)

- WR LEN Standalone kit
- Synchronization over daisy chain configurations
- Distribute accurate timing
- Sub-nanosecond time accuracy
- Distance range: Over 80km fiber
- Dual optical fiber
- Ethernet 1G interfaces
- Synchronize IRIG-B device

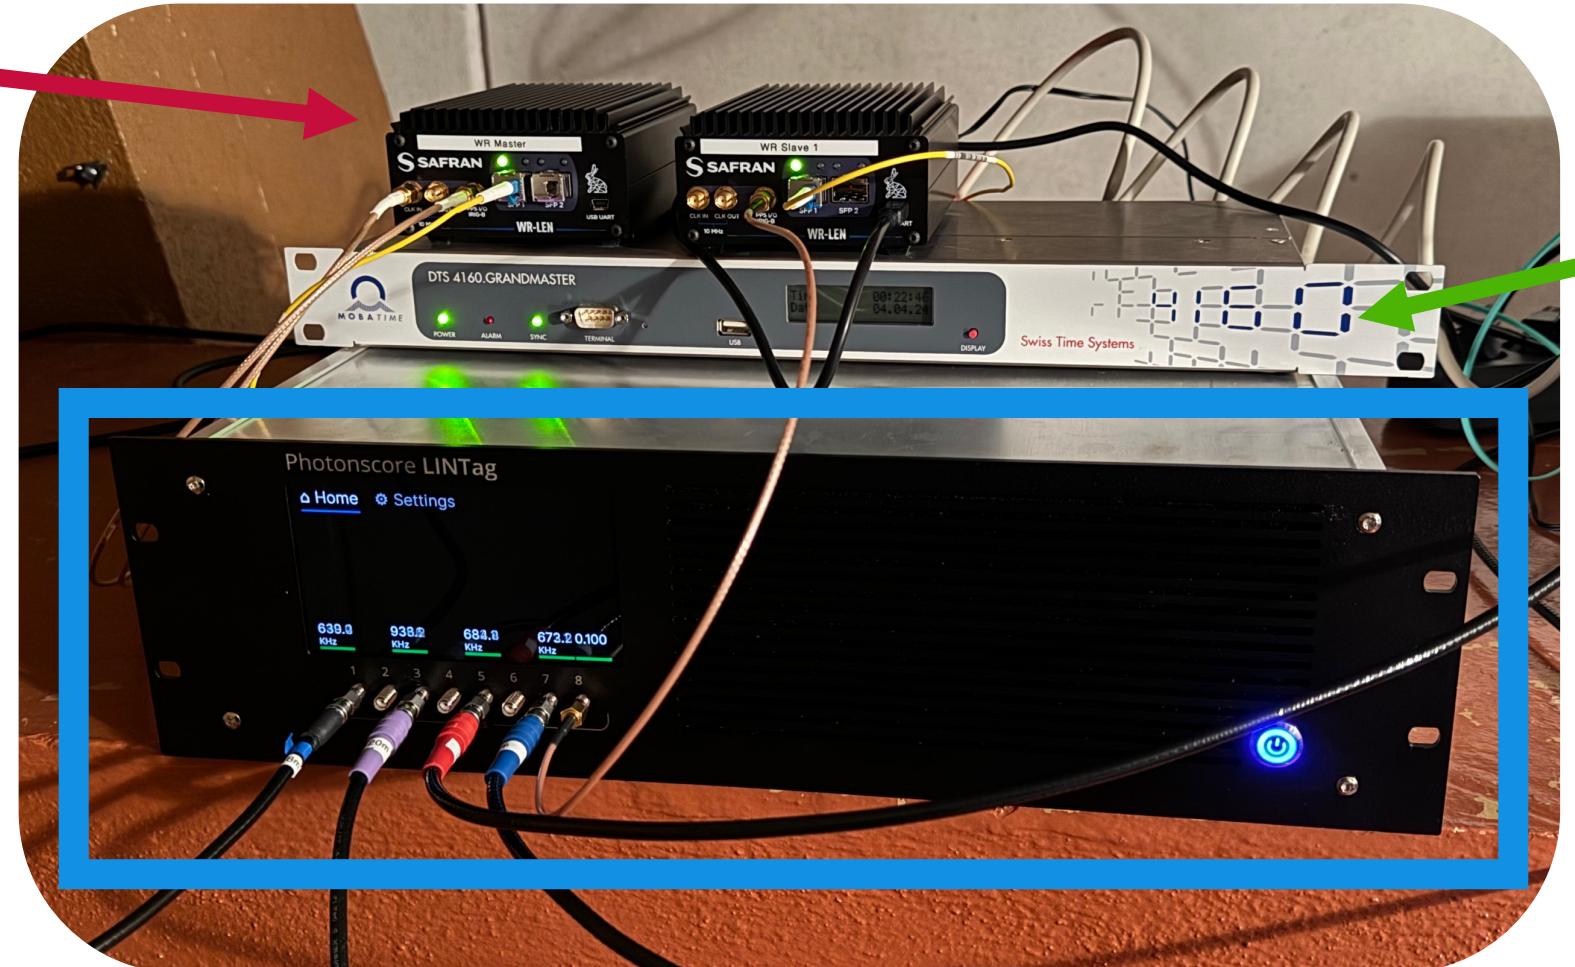

Synchronization Hardware

FAU

White
Rabbit
LEN

LINTag
TDC

NTP
Grand-
master

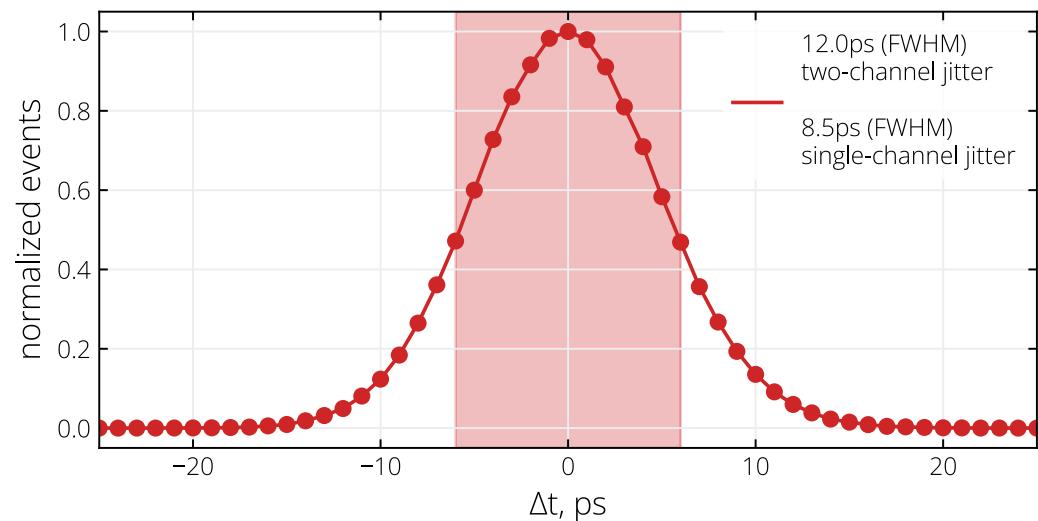

LINTag from Photonscore

- time-tagger system for ultra-fast data acquisition
- Temporal accuracy of 8.5ps (FWHM) / 3.6ps (RMS)
- 10G Ethernet SFB+ connection
- full-stack TCP/IP interface
- Transfer up to 400 MEvents/s
- Multi-Start Multi-Stop correlation

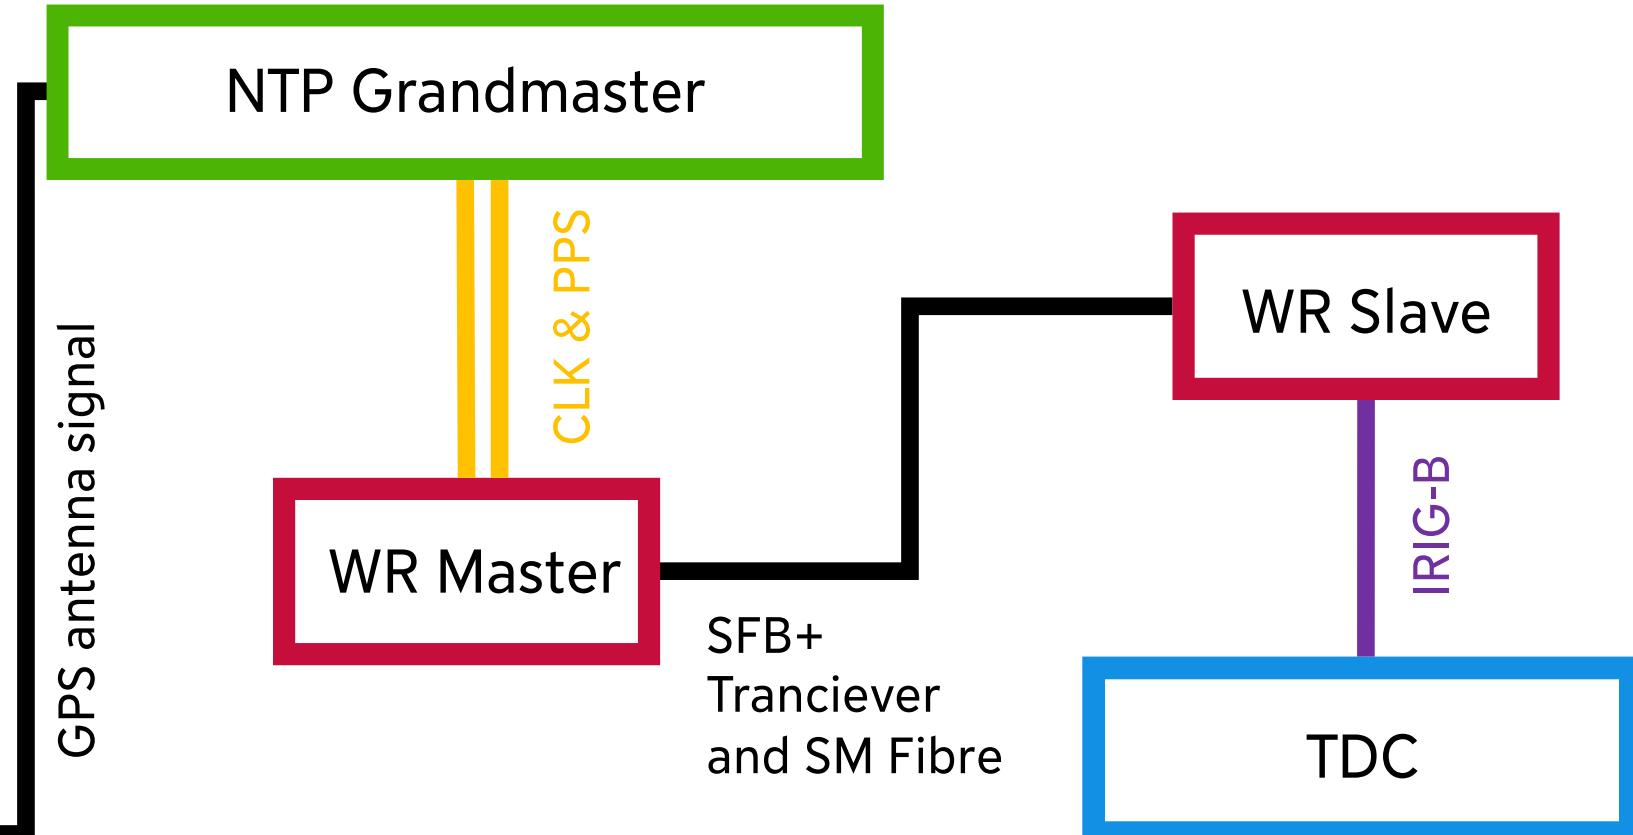

Timing jitter

Bunching

Cross-Correlation

Visibility curve for Vega

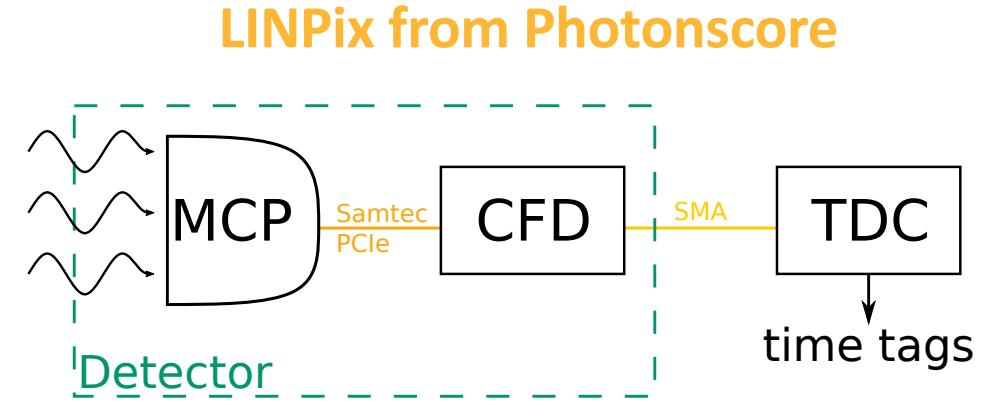

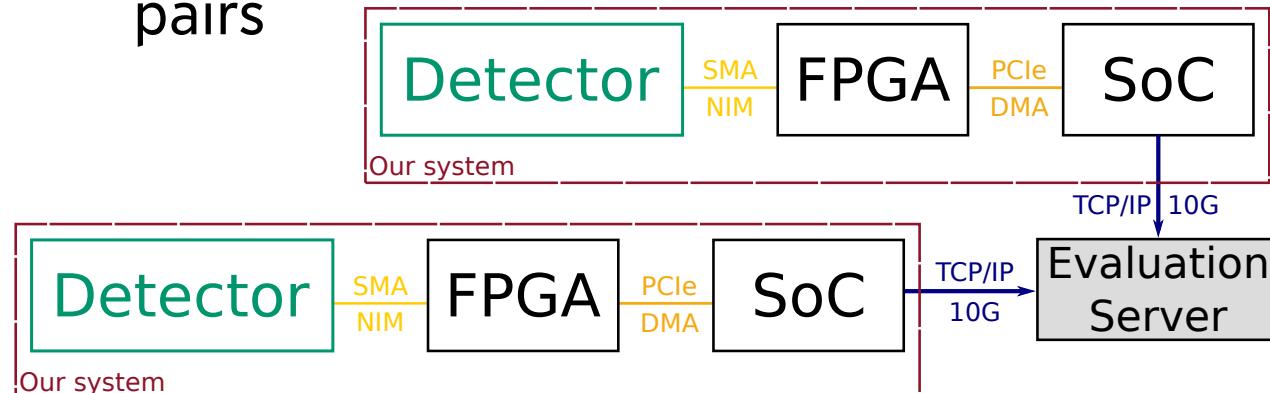

The background of the slide is a dark, star-filled image of a galaxy cluster or field, showing numerous small, glowing blue and yellow points of light against a black void.

High Throughput System (HTS)

High Throughput System (HTS)

- Detector = LINPix and TDC = LINTag
- Timetags of FPGA will be sorted and compressed by SoC
- reliable, ordered and error-checked data delivery to server
- Evaluation server correlates all channel pairs

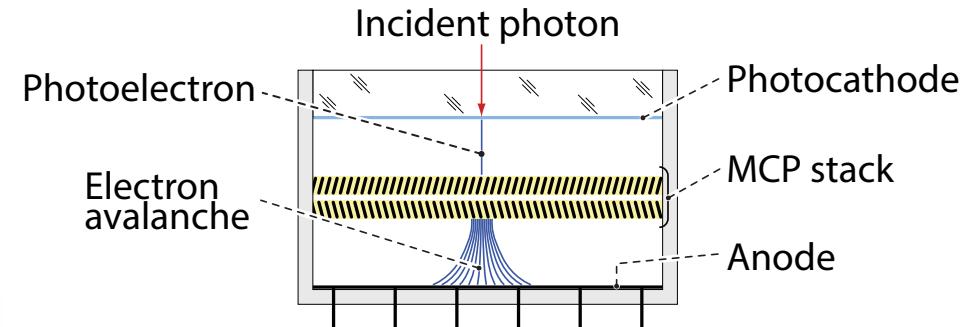

- Integrated CFD
- NIM output
→ long cables
- Count rates >100MHz
- Ø8mm active area

LINPix from Photonscore

Ceramic Vacuum Assembly: Photocathode + Multichannel Plates

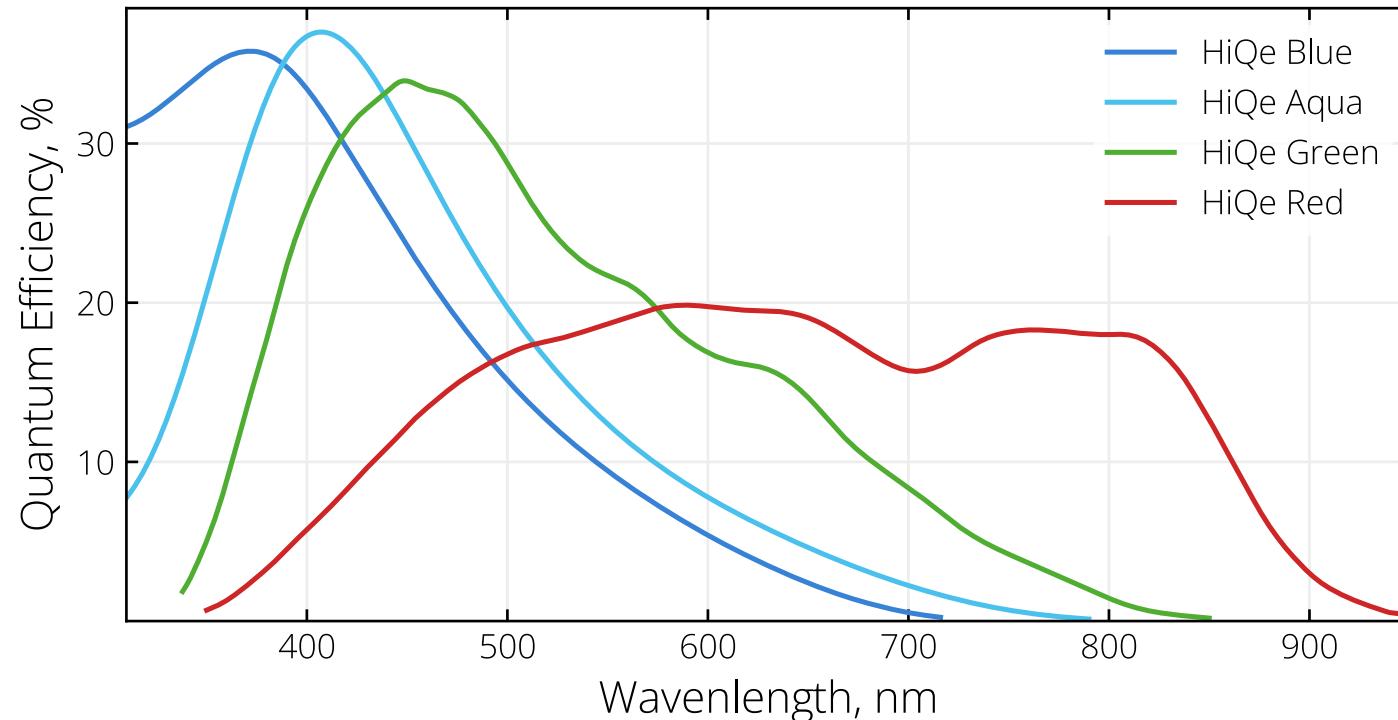

- Channel width = $6\mu\text{m}$
- Channel distance = $1\mu\text{m}$
- Channel tilt = $5 - 10^\circ$
- Chevron stack → gain > 10^6

Photonscore.

Measurement Configuration

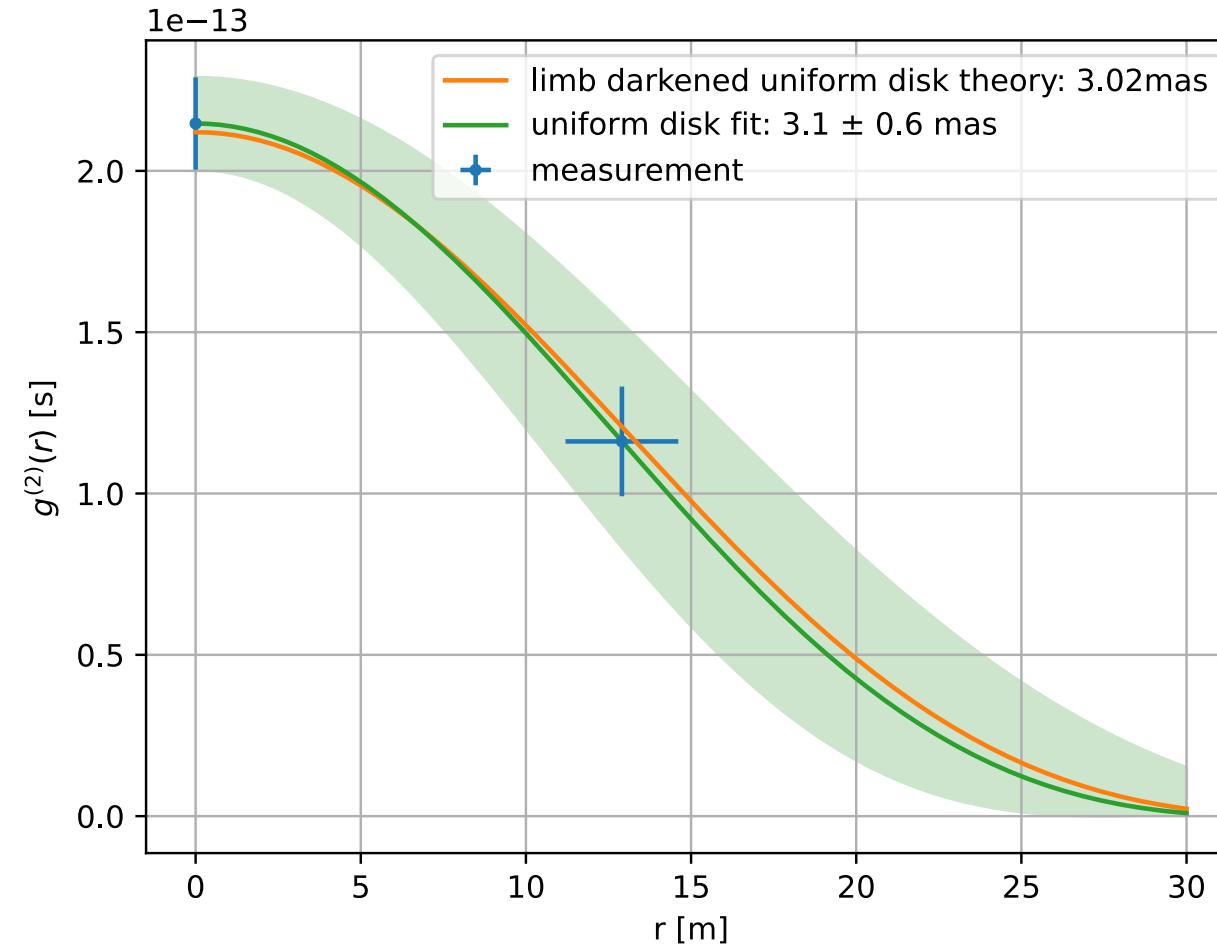

Temporal Correlations using HTS

Spatial Correlations using HTS

Visibility curve for Vega

Summary & Outlook

Summary and Outlook

Summary

- Verified stability of setup
- Measured Bunching and spatial correlations using HPDs
- Successfully tested LINPix and LINTag

To Do:

- 1) Check filter position
- 2) Higher count rates?
- 3) Bursts? 
- 4) Km baselines?

Outlook

- 1) Measure backreflection
- 2) Try 100MHz bunching
- 3) Check burst capability of LINPix
- 4) Try WR with long fibers and test synchronizability of multiple TDCs

**Thank you
for your attention**
